

HBase Java Administrative API

Originals of Slides and Source Code for Examples:

<http://www.coreservlets.com/hadoop-tutorial/>

Customized Java EE Training: <http://courses.coreservlets.com/>

Hadoop, Java, JSF 2, PrimeFaces, Servlets, JSP, Ajax, jQuery, Spring, Hibernate, RESTful Web Services, Android.
Developed and taught by well-known author and developer. At public venues or onsite at *your* location.

**For live Hadoop training, please see courses
at <http://courses.coreservlets.com/>.**

**Taught by the author of this Hadoop tutorial. Available
at public venues, or customized versions can be held
on-site at your organization.**

- Courses developed and taught by Marty Hall
 - JSF 2, PrimeFaces, servlets/JSP, Ajax, jQuery, Android development, Java 6 or 7 programming, custom mix of topics
 - Ajax courses can concentrate on 1 library (jQuery, Prototype/Scriptaculous, Ext-JS, Dojo, etc.) or survey several
 - Courses developed and taught by coreservlets.com experts (edited by Marty)
 - **Hadoop**, Spring, Hibernate/JPA, GWT, SOAP-based and RESTful Web Services
- Contact hall@coreservlets.com for details**

Agenda

- **Create Table**
- **Drop Table**

4

Java Admin API

- **Just like HTable is for client API
HBaseAdmin is for administrative tasks**
 - `org.apache.hadoop.hbase.client.HBaseAdmin`
- **Recall that only Table and Family names
have to be pre-defined**
 - Columns can be added/deleted dynamically
 - HBase scheme roughly equals table definitions and their column families

5

Create Table and Column Families

- 1. Construct HBaseAdmin instance**
- 2. Create Table's schema**
 - Represented by HTableDescriptor class
 - Add column families to table descriptor (HColumnDescriptor)
- 3. Execute create via HBaseAdmin class**

6

1: Construct HBaseAdmin Instance

- **HbaseAdmin's constructor requires an instance of Configuration object**
 - Similar to HTable
 - We already know how to do that

```
Configuration conf = HBaseConfiguration.create();  
HBaseAdmin admin = new HBaseAdmin(conf);
```

7

2: Create Table Descriptor

- **org.apache.hadoop.hbase.HTableDescriptor**
 - Serves as a container for table name and column families
 - Most importantly, add one or more column families
 - org.apache.hadoop.hbase.HColumnDescriptor
 - HColumnDescriptor serves as a container for column family name, compressions settings, number of versions, in-memory setting, and block size

```
HTableDescriptor table = new HTableDescriptor(toBytes("Table"));
HColumnDescriptor family = new HColumnDescriptor(toBytes("f"));
table.addFamily(family);
HColumnDescriptor family1 = new HColumnDescriptor(toBytes("f1"));
table.addFamily(family1);
```

8

3: Execute Create via HBaseAdmin

- **HBaseAdmin creates a table via createTable method**
 - Synchronous operation

```
admin.createTable(table);
```

9

CreateTableExample.java

```
public static void main(String[] args) throws IOException {
    Configuration conf = HBaseConfiguration.create();
    HBaseAdmin admin = new HBaseAdmin(conf);

    String name = "NewTable";
    byte [] tableName = toBytes(name);

    HTableDescriptor table = new HTableDescriptor(tableName);
    HColumnDescriptor family =
        new HColumnDescriptor(toBytes("new_family"));
    table.addFamily(family);

    System.out.println("Table "+name+" exist: " +
        admin.tableExists(tableName) );
    System.out.println("Creating "+name+" table...");
    admin.createTable(table);
    System.out.println("Table "+name+" exist: " +
        admin.tableExists(tableName) );
}
```

10

Test CreateTableExample.java

```
$ yarn jar $PLAY_AREA/HadoopSamples.jar hbase.CreateTableExample
```

...

```
Table NewTable exist: false
```

```
Creating NewTable table...
```

```
Table NewTable exist: true
```

```
$ hbase shell
```

```
hbase> describe 'NewTable'
```

```
DESCRIPTION
```

```
ENABLED
```

```
{(NAME => 'NewTable', FAMILIES => [(NAME => 'new_family',
BLOOMFILTER => 'NONE', REPLICATION_SCOPE => '0',
COMPRESSION => 'NONE', VERSIONS => '3', TTL =>
'2147483647', BLOCKSIZE => '65536', IN_MEMORY => 'false',
BLOCKCACHE => 'true')])}
```

```
true
```

```
1 row(s) in 0.0400 seconds
```

11

Drop Table

1. **Construct HBaseAdmin instance**
2. **Disable table**
 - Table must be taken offline in order to perform any schema modifications
3. **Delete table**

12

DropTableExample.java

```
public static void main(String[] args) throws IOException {
    Configuration conf = HBaseConfiguration.create();

    HBaseAdmin admin = new HBaseAdmin(conf);
    byte [] tableName = toBytes("NewTable");

    admin.disableTable(tableName);

    admin.deleteTable(tableName);
}
```

Bytes utility class is imported with 'static' keyword:
`import static org.apache.hadoop.hbase.util.Bytes.toBytes;`

13

Test DropTableExample.java

```
$ hbase shell
hbase> exists 'NewTable'
Table NewTable does exist
0 row(s) in 0.1420 seconds
hbase> quit

$ yarn jar $PLAY_AREA/HadoopSamples.jar hbase.DropTableExample
...
12/01/16 12:21:44 INFO client.HBaseAdmin: Started disable of NewTable
12/01/16 12:21:46 INFO client.HBaseAdmin: Disabled NewTable
12/01/16 12:21:46 INFO client.HBaseAdmin: Deleted NewTable

$ hbase shell
hbase> exists 'NewTable'
Table NewTable does not exist
0 row(s) in 0.3700 seconds
```

Wrap-Up

Customized Java EE Training: <http://courses.coreservlets.com/>

Hadoop, Java, JSF 2, PrimeFaces, Servlets, JSP, Ajax, jQuery, Spring, Hibernate, RESTful Web Services, Android.

Developed and taught by well-known author and developer. At public venues or onsite at *your* location.

Summary

- **We learned how to**
 - Create new table
 - Drop an existing table
