HBase Installation & Shell

Originals of Slides and Source Code for Examples:
http://www.coreservlets.com/hadoop-tutorial/

Customized Java EE Training: http://courses.coreservlets.com/
Hadoop, Java, JSF 2, PrimeFaces, Servlets, JSP, Ajax, jQuery, Spring, Hibernate, RESTful Web Services, Android.
Developed and taught by well-known author and developer. At public venues or onsite at *your* location.
For live Hadoop training, please see courses at http://courses.coreservlets.com/.

Taught by the author of this Hadoop tutorial. Available at public venues, or customized versions can be held on-site at your organization.

• Courses developed and taught by Marty Hall
 – JSF 2, PrimeFaces, servlets/JSP, Ajax, jQuery, Android development, Java 6 or 7 programming, custom mix of topics
 – Ajax courses can concentrate on 1 library (jQuery, Prototype/Scriptaculous, Ext-JS, Dojo, etc.) or survey several
• Courses developed and taught by coreservlets.com experts (edited by Marty)
 – **Hadoop,** Spring, Hibernate/JPA, GWT, SOAP-based and RESTful Web Services
 Contact hall@coreservlets.com for details

Agenda

- **Learn about installation modes**
- **How to set-up Pseudo-Distributed Mode**
- **HBase Management Console**
- **HBase Shell**
  - Define Schema
  - Create, Read, Update and Delete

4

Runtime Modes

- **Local (Standalone) Mode**
  - Comes Out-of-the-Box, easy to get started
  - Uses local filesystem (not HDFS), NOT for production
  - Runs HBase & Zookeeper in the same JVM
- **Pseudo-Distributed Mode**
  - Requires HDFS
  - Mimics Fully-Distributed but runs on just one host
  - Good for testing, debugging and prototyping
  - Not for production use or performance benchmarking!
  - Development mode used in class
- **Fully-Distributed Mode**
  - Run HBase on many machines
  - Great for production and development clusters

5

Set Up Pseudo-Distributed Mode

1. **Verify Installation Requirements**
   – Java, password-less SSH
2. **Configure Java**
3. **Configure the use of HDFS**
   – Specify the location of Namenode
   – Configure replication
4. **Make sure HDFS is running**
5. **Start HBase**
6. **Verify HBase is running**

6

1: Verify Installation Requirements

- **Latest release of Java 6 from Oracle**
- **Must have compatible release of Hadoop!**
  – runs of top of HDFS
  – Today runs on Hadoop 0.20.x
  – Can run on top of local FS
    - Will lose data when crashes
    - Needs HDFS's durable sync for data fault-tolerance
      – HDFS provides confirmation that the data has been saved
      – Confirmation is provided after all blocks are successfully replicated to all the required nodes

7

1: Verify Installation Requirements

- **SSH installed, sshd must be running**
  - Just like Hadoop
  - Need password-less SSH to all the nodes including yourself
  - Required for both pseudo-distributed and fully-distributed modes
- **Windows**
  - Very little testing – for development only
  - Will need <u>Cygwin</u>

2: Configure Java

- **vi <HBASE_HOME>/conf/hbase-env.sh**

```
export JAVA_HOME=/usr/java/jdk1.6.0
```

3: Configure the use of HDFS

- **Point to HDFS for its filesystem**
  - Edit <hbase_home>/conf/hbase-site.xml
  - hbase.rootdir property:
    - Uses HDFS URI
    - Recall URI format: scheme://namenode/path
      - Example: hdfs://localhost:9000/hbase
    - The location of namenode
    - directory on HDFS where Region Servers will save it's data
      - If directory doesn't exist it will be created
  - dfs.replication property:
    - The number of times data will be replicated across Region Servers (HLog and HFile)
    - Will set to 1 since there is only 1 host

3: Configure the use of HDFS

<hbase_home>/conf/hbase-site.xml

```
<configuration>
  ...
  <property>
    <name>hbase.rootdir</name>
    <value>hdfs://localhost:9000/hbase</value>
    <description>The directory shared by RegionServers.
    </description>
  </property>
  <property>
    <name>dfs.replication</name>
    <value>1</value>
    <description>The replication count for HLog and HFile
storage. Should not be greater than HDFS datanode count.
    </description>
  </property>
  ...
</configuration>
```

Will this configuration work on a remote client?

3: Configure the use of HDFS

- **Since 'localhost' was specified as the location of the namenode remote clients can't use this configuration**

```
...
  <property>
    <name>hbase.rootdir</name>
    <value>hdfs://localhost:9000/hbase</value>
</property>
...
```

4: Make sure HDFS is running

- **Make sure HDFS is running**
  - Easy way is to check web-based management console
    - http://localhost:50070/dfshealth.jsp
  - Or use command line
    - $ hdfs dfs -ls /

5: Start HBase

```
$ cd <hbase_home>/bin
$ ./start-hbase.sh
starting master, logging to
/home/hadoop/Training/logs/hbase/hbase-hadoop-master-
hadoop-laptop.out
...
```

6: Verify HBase is Running

```
$ hbase shell
HBase Shell; enter 'help<RETURN>' for list of supported commands.
Type "exit<RETURN>" to leave the HBase Shell
Version 0.90.4-cdh3u2, r, Thu Oct 13 20:32:26 PDT 2011
hbase(main):001:0> list
TABLE
0 row(s) in 0.4070 seconds
```

Run a command to verify
that cluster is actually running

```
$ hadoop fs -ls /hbase
Found 5 items
drwxr-xr-x  - hadoop supergroup  0 2011-12-31 13:18 /hbase/-ROOT-
drwxr-xr-x  - hadoop supergroup  0 2011-12-31 13:18 /hbase/.META.
drwxr-xr-x  - hadoop supergroup  0 2011-12-31 13:18 /hbase/.logs
drwxr-xr-x  - hadoop supergroup  0 2011-12-31 13:18 /hbase/.oldlogs
-rw-r--r--  1 hadoop supergroup  3 2011-12-31 13:18 /hbase/hbase.version
```

HBase data and metadata is stored in HDFS

6: Verify HBase is Running

- **By default HBase manages Zookeeper daemon for you**
- **Logs by default go to <hbase_home>/logs**
  - Change the default by editing <hbase_home>/conf/hbase-env.sh
    - export HBASE_LOG_DIR=/new/location/logs

16

HBase Management Console

- **HBase comes with web based management**
  - http://localhost:60010
- **Both Master and Region servers run web server**
  - Browsing Master will lead you to region servers
    - Regions run on port 60030
- **Firewall considerations**
  - Opening <master_host>:60010 in firewall is not enough
  - Have to open up <region(s)_host>:60030 on every slave host
  - An easy option is to open a browser behind the firewall
    - SSH tunneling and Virtual Network Computing (VNC)

17

HBase Management Console

HBase Shell

- **JRuby IRB (Interactive Ruby Shell)**
  - HBase commands added
  - If you can do it in IRB you can do it in HBase shell
    - http://en.wikipedia.org/wiki/Interactive_Ruby_Shell
- **To run simply**

  $ <hbase_install>/bin/hbase shell
  HBase Shell; enter 'help<RETURN>' for list of supported commands.
  Type "exit<RETURN>" to leave the HBase Shell
  Version 0.90.4-cdh3u2, r, Thu Oct 13 20:32:26 PDT 2011
  hbase(main):001:0>

  - Puts you into IRB
  - Type 'help' to get a listing of commands
    - $ help "command" (quotes are required)
      - > help "get"

HBase Shell

- **Quote all names**
  - Table and column names
  - Single quotes for text
    - hbase> get 't1', 'myRowId'
  - Double quotes for binary
    - Use hexadecimal representation of that binary value
    - hbase> get 't1', "key\x03\x3f\xcd"
- **Uses ruby hashes to specify parameters**
  - {'key1' => 'value1', 'key2' => 'value2', …}
  - Example:

```
hbase> get 'UserTable', 'userId1', {COLUMN => 'address:str'}
```

HBase Shell

- **HBase Shell supports various commands**
  - General
    - status, version
  - Data Definition Language (DDL)
    - alter, create, describe, disable, drop, enable, exists, is_disabled, is_enabled, list
  - Data Manipulation Language (DML)
    - count, delete, deleteall, get, get_counter, incr, put, scan, truncate
  - Cluster administration
    - balancer, close_region, compact, flush, major_compact, move, split, unassign, zk_dump, add_peer, disable_peer, enable_peer, remove_peer, start_replication, stop_replication
- **Learn more about each command**
  - hbase> help "<command>"

HBase Shell - Check Status

- **Display cluster's status via status command**
  - hbase> status
  - hbase> status 'detailed'
- **Similar information can be found on HBase Web Management Console**
  - http://localhost:60010

HBase Shell - Check Status

```
hbase> status
1 servers, 0 dead, 3.0000 average load

hbase> status 'detailed'
version 0.90.4-cdh3u2
0 regionsInTransition
1 live servers
    hadoop-laptop:39679 1326056194009
        requests=0, regions=3, usedHeap=30, maxHeap=998
        .META.,,1
            stores=1, storefiles=0, storefileSizeMB=0, …
        -ROOT-,,0
            stores=1, storefiles=1, storefileSizeMB=0, …
        Blog,,1326059842133.c1b865dd916b64a6228ecb4f743 …
0 dead servers
```

HBase Shell DDL and DML

- **Let's walk through an example**
    1. Create a table
        - Define column families
    2. Populate table with data records
        - Multiple records
    3. Access data
        - Count, get and scan
    4. Edit data
    5. Delete records
    6. Drop table

1: Create Table

- **Create table called 'Blog' with the following schema**
    - 2 families
        - 'info' with 3 columns: 'title', 'author', and 'date'
        - 'content' with 1 column family: 'post'

Blog		
Family:	info:	Columns: title, author, date
	content:	Columns: post

1: Create Table

- **Various options to create tables and families**
  - hbase> create 't1', {NAME => 'f1', VERSIONS => 5}
  - hbase> create 't1', {NAME => 'f1', VERSIONS => 1, TTL => 2592000, BLOCKCACHE => true}
  - hbase> create 't1', {NAME => 'f1'}, {NAME => 'f2'}, {NAME => 'f3'}
  - hbase> create 't1', 'f1', 'f2', 'f3'

```
hbase> create 'Blog', {NAME=>'info'}, {NAME=>'content'}
0 row(s) in 1.3580 seconds
```

2: Populate Table With Data Records

- **Populate data with multiple records**

| Row Id	info:title	info:author	info:date	content:post
Matt-001	Elephant	Matt	2009.05.06	Do elephants like monkeys?
Matt-002	Monkey	Matt	2011.02.14	Do monkeys like elephants?
Bob-003	Dog	Bob	1995.10.20	People own dogs!
Michelle-004	Cat	Michelle	1990.07.06	I have a cat!
John-005	Mouse	John	2012.01.15	Mickey mouse.

- **Put command format:**

```
hbase> put 'table', 'row_id', 'family:column', 'value'
```

2: Populate Table With Data Records

```
# insert row 1
put 'Blog', 'Matt-001', 'info:title', 'Elephant'
put 'Blog', 'Matt-001', 'info:author', 'Matt'
put 'Blog', 'Matt-001', 'info:date', '2009.05.06'
put 'Blog', 'Matt-001', 'content:post', 'Do elephants like monkeys?'
…
…
… # insert rows 2-4
…
…

# row 5
put 'Blog', 'John-005', 'info:title', 'Mouse'
put 'Blog', 'John-005', 'info:author', 'John'
put 'Blog', 'John-005', 'info:date', '1990.07.06'
put 'Blog', 'John-005', 'content:post', 'Mickey mouse.'
```

1 put statement per cell

3. Access data - count

- **Access Data**
  - count: display the total number of records
  - get: retrieve a single row
  - scan: retrieve a range of rows
- **Count is simple**
  - hbase> count 'table_name'
  - Will scan the entire table! May be slow for a large table
    - Alternatively can run a MapReduce job (more on this later...)
      - $ yarn jar hbase.jar rowcount
  - Specify count to display every n rows. Default is 1000
    - hbase> count 't1', INTERVAL => 10

3. Access data - count

```
hbase> count 'Blog', {INTERVAL=>2}
Current count: 2, row: John-005
Current count: 4, row: Matt-002
5 row(s) in 0.0220 seconds

hbase> count 'Blog', {INTERVAL=>1}
Current count: 1, row: Bob-003
Current count: 2, row: John-005
Current count: 3, row: Matt-001
Current count: 4, row: Matt-002
Current count: 5, row: Michelle-004
```

Affects how often
count is displayed

3. Access data - get

- **Select single row with 'get' command**
  – hbase> get 'table', 'row_id'
    - Returns an entire row
  – Requires table name and row id
  – Optional: timestamp or time-range, and versions
- **Select specific columns**
  – hbase> get 't1', 'r1', {COLUMN => 'c1'}
  – hbase> get 't1', 'r1', {COLUMN => ['c1', 'c2', 'c3']}
- **Select specific timestamp or time-range**
  – hbase> get 't1', 'r1', {TIMERANGE => [ts1, ts2]}
  – hbase> get 't1', 'r1', {COLUMN => 'c1', TIMESTAMP => ts1}
- **Select more than one version**
  – hbase> get 't1', 'r1', {VERSIONS => 4}

3. Access data - get

```
hbase> get 'Blog', 'unknownRowId'
COLUMN              CELL
0 row(s) in 0.0250 seconds
```

Row Id doesn't exist

```
hbase> get 'Blog', 'Michelle-004'
COLUMN                    CELL
content:post    timestamp=1326061625690, value=I have a cat!
info:author     timestamp=1326061625630, value=Michelle
info:date       timestamp=1326061625653, value=1990.07.06
info:title      timestamp=1326061625608, value=Cat
4 row(s) in 0.0420 seconds
```

Returns ALL the columns, displays 1
column per row!!!

3. Access data - get

Narrow down to just two columns

```
hbase> get 'Blog', 'Michelle-004',
            {COLUMN=>['info:author','content:post']}
COLUMN              CELL
content:post timestamp=1326061625690, value=I have a cat!
info:author        timestamp=1326061625630, value=Michelle
2 row(s) in 0.0100 seconds
```

Narrow down via columns and timestamp

```
hbase> get 'Blog', 'Michelle-004',
                {COLUMN=>['info:author','content:post'],
                TIMESTAMP=>1326061625690}
COLUMN              CELL
content:post timestamp=1326061625690, value=I have a cat!
1 row(s) in 0.0140 seconds
```

Only one timestamp matches

3. Access data - get

```
hbase> get 'Blog', 'Michelle-004',
                        {COLUMN=>'info:date', VERSIONS=>2}
COLUMN                 CELL
info:date              timestamp=1326071670471, value=1990.07.08
info:date              timestamp=1326071670442, value=1990.07.07
2 row(s) in 0.0300 seconds
```

Asks for the latest two versions

```
hbase> get 'Blog', 'Michelle-004',
                        {COLUMN=>'info:date'}
COLUMN                 CELL
info:date              timestamp=1326071670471, value=1990.07.08
1 row(s) in 0.0190 seconds
```

By default only the latest version is returned

34

3. Access data - Scan

- **Scan entire table or a portion of it**
- **Load entire row or explicitly retrieve column families, columns or specific cells**
- **To scan an entire table**
  - hbase> scan 'table_name'
- **Limit the number of results**
  - hbase> scan 'table_name', {LIMIT=>1}
- **Scan a range**
  - hbase> scan 'Blog', {STARTROW=>'startRow', STOPROW=>'stopRow'}
  - Start row is inclusive, stop row is exclusive
  - Can provide just start row or just stop row

35

3. Access data - Scan

- **Limit what columns are retrieved**
  - hbase> scan 'table', {COLUMNS=>['col1', 'col2']}
- **Scan a time range**
  - hbase> scan 'table', {TIMERANGE => [1303, 13036]}
- **Limit results with a filter**
  - hbase> scan 'Blog', {FILTER => org.apache.hadoop.hbase.filter.ColumnPaginationFilter.new(1, 0)}
  - More about filters later

3. Access data - Scan

Scan the entire table, grab ALL the columns

```
hbase(main):014:0> scan 'Blog'
ROW                    COLUMN+CELL
Bob-003 column=content:post, timestamp=1326061625569,
                            value=People own dogs!
Bob-003 column=info:author, timestamp=1326061625518, value=Bob
Bob-003 column=info:date, timestamp=1326061625546,
                            value=1995.10.20
Bob-003 column=info:title, timestamp=1326061625499, value=Dog
John-005       column=content:post, timestamp=1326061625820,
                            value=Mickey mouse.
John-005       column=info:author, timestamp=1326061625758,
                            value=John
…
Michelle-004   column=info:author, timestamp=1326061625630,
                            value=Michelle
Michelle-004   column=info:date, timestamp=1326071670471,
                            value=1990.07.08
Michelle-004   column=info:title, timestamp=1326061625608,
                            value=Cat
5 row(s) in 0.0670 seconds
```

3. Access data - Scan

Stop row is exclusive, row ids that
start with John will not be included

```
hbase> scan 'Blog', {STOPROW=>'John'}
ROW       COLUMN+CELL
Bob-003   column=content:post, timestamp=1326061625569,
                             value=People own dogs!
Bob-003   column=info:author, timestamp=1326061625518,
                             value=Bob
Bob-003   column=info:date, timestamp=1326061625546,
                             value=1995.10.20
Bob-003       column=info:title, timestamp=1326061625499,
                             value=Dog
1 row(s) in 0.0410 seconds
```

3. Access data - Scan

Only retrieve 'info:title' column

```
hbase> scan 'Blog', {COLUMNS=>'info:title',
          STARTROW=>'John', STOPROW=>'Michelle'}
ROW            COLUMN+CELL
John-005       column=info:title, timestamp=1326061625728,
                                   value=Mouse
Matt-001       column=info:title, timestamp=1326061625214,
                                   value=Elephant
Matt-002       column=info:title, timestamp=1326061625383,
                                   value=Monkey
3 row(s) in 0.0290 seconds
```

4: Edit data

- **Put command inserts a new value if row id doesn't exist**
- **Put updates the value if the row does exist**
- **But does it really update?**
  - Inserts a new version for the cell
  - Only the latest version is selected by default
  - N versions are kept per cell
    - configured per family at creation:

      hbase> create 'table', {NAME => 'family', VERSIONS => 7}

    - 3 versions are kept by default

4: Edit data

```
hbase> put 'Blog', 'Michelle-004', 'info:date', '1990.07.06'
0 row(s) in 0.0520 seconds
hbase> put 'Blog', 'Michelle-004', 'info:date', '1990.07.07'
0 row(s) in 0.0080 seconds
hbase> put 'Blog', 'Michelle-004', 'info:date', '1990.07.08'
0 row(s) in 0.0060 seconds
```

Update the same exact row with a different value

```
hbase> get 'Blog', 'Michelle-004',
                   {COLUMN=>'info:date', VERSIONS=>3}
COLUMN                CELL
info:date             timestamp=1326071670471, value=1990.07.08
info:date             timestamp=1326071670442, value=1990.07.07
info:date             timestamp=1326071670382, value=1990.07.06
3 row(s) in 0.0170 seconds
```

Keeps three versions of each cell by default

4: Edit data

```
hbase> get 'Blog', 'Michelle-004',
                 {COLUMN=>'info:date', VERSIONS=>2}
COLUMN        CELL
info:date     timestamp=1326071670471, value=1990.07.08
info:date     timestamp=1326071670442, value=1990.07.07
2 row(s) in 0.0300 seconds
```

Asks for the latest two versions

```
hbase> get 'Blog', 'Michelle-004',
                 {COLUMN=>'info:date'}
COLUMN                    CELL
info:date     timestamp=1326071670471, value=1990.07.08
1 row(s) in 0.0190 seconds
```

By default only the latest version is returned

5: Delete records

- **Delete cell by providing table, row id and column coordinates**
  - delete 'table', 'rowId', 'column'
  - Deletes all the versions of that cell
- **Optionally add timestamp to only delete versions before the provided timestamp**
  - delete 'table', 'rowId', 'column', timestamp

5: Delete records

```
hbase> get 'Blog', 'Bob-003', 'info:date'
COLUMN          CELL
info:date      timestamp=1326061625546, value=1995.10.20
1 row(s) in 0.0200 seconds

hbase> delete 'Blog', 'Bob-003', 'info:date'
0 row(s) in 0.0180 seconds

hbase> get 'Blog', 'Bob-003', 'info:date'
COLUMN          CELL
0 row(s) in 0.0170 seconds
```

44

5: Delete records

```
hbase> get 'Blog', 'Michelle-004',
                         {COLUMN=>'info:date', VERSIONS=>3}
COLUMN          CELL
info:date      timestamp=1326254742846, value=1990.07.08
info:date      timestamp=1326254739790, value=1990.07.07
info:date      timestamp=1326254736564, value=1990.07.06
3 row(s) in 0.0120 seconds
```

3 versions

```
hbase> delete 'Blog', 'Michelle-004', 'info:date', 1326254739791
0 row(s) in 0.0150 seconds
```

1 millisecond after the second version

```
hbase> get 'Blog', 'Michelle-004',
                         {COLUMN=>'info:date', VERSIONS=>3}
COLUMN               CELL
info:date            timestamp=1326254742846, value=1990.07.08
1 row(s) in 0.0090 seconds
```

After the timestamp provided at delete statement

45

6: Drop table

- **Must disable before dropping**
  - puts the table "offline" so schema based operations can be performed
  - `hbase> disable 'table_name'`
  - `hbase> drop 'table_name'`
- **For a large table it may take a long time....**

6: Drop table

```
hbase> list
TABLE
Blog
1 row(s) in 0.0120 seconds

hbase> disable 'Blog'
0 row(s) in 2.0510 seconds

hbase> drop 'Blog'
0 row(s) in 0.0940 seconds

hbase> list
TABLE
0 row(s) in 0.0200 seconds
```

Take the table offline for schema modifications

Wrap-Up

Summary

- **We learned**
  - How to install HBase in Pseudo-Distributed Mode
  - How to use HBase Shell
  - HBase Shell commands
